

Save Time Verifying Fixes

test IO's **Bug Fix Confirmation** uses professional testers to verify bug fixes on real devices, freeing up in-house QA and development resources.

Checking that software issues are truly resolved can be a bottleneck for teams. Don't spend the valuable time of developers, product managers, and QA analysts when you can use test IO's bug fix confirmation to initiate a targeted review.

With test IO's Bug Fix Confirmation (BFC), our testers will confirm *within 30 minutes* that the issues have been fixed on real-world devices and in real-world conditions.

How It Works

Once test IO's crowdtesters report a software issue, your software team uses the detailed bug report to fix the bug in the code. When the patch is complete, bug fix confirmation verifies that the issue is resolved, saving your team hours of fix confirmations.

How It Helps

It can take in-house teams up to *four hours* to verify a fix. If your team is verifying, at minimum, one fix a day for five days, that's nearly an entire day spent! With BFC, not only can these results be returned to you in a total of two and a half hours, your team's time spent shrinks to 0.
