

The Onboarding Process

Any vendor that says something is going to be the perfect solution on day one is not telling the truth. To properly implement any tool, it takes times time to understand best practices.

Our Customer Success Managers are QA experts who work with you throughout the onboarding process to best implement the test IO platform into your QA process. They provide consultation in test design and on-going support for fine-tuning crowdtesting cycles.

Although every customer is different and bears unique challenges, by the end of the pilot period, we're up and running the way *you* need us to be. The job of our team is to bend the platform around the way you work, not the other way around.

Unlike other DevOps products out there, you're not just purchasing a product right off the shelf, you're using a platform that has been molded to your needs since your first conversation with our team.

<24 Hours

Time to first test

The average customer tests the second day after onboarding, but others have launched only an hour after our first call.

3 Days

Time saved during pilot period

We save teams up to eight hours per week of time otherwise lost to manual testing. This equates to over 60 hours of time saved during the pilot period alone.
